

# Sprint 1

**Deadline: Monday, January 19, 11:59pm.**

---

## Overview

The primary goal of this sprint is to ensure that all team members have their development environment set up to work with the required tools for this course and that your team understands how to deploy your application to your team server.

You will do this by making small changes to the TODO List application found in your team's GitLab group. The YADTL (yet another to-do list) project was created by Dr. Judi McCuaig for CIS\*3760 in the summer of 2024, and it is an excellent platform for introducing you to the tools we will use in the course. The project is in the [yadt1](#) repository.

The sprint board for this sprint has been pre-configured in your team's GitLab group. On it, you will find:

- Four user stories
- One bug
- One technical task

Each user story must be broken down into the development and testing tasks necessary to accomplish the user story. At a minimum, you will have tasks to modify and test the backend, frontend, and database for each user story. You may also need to break down the bug and the tech task into smaller tasks. Use GitLab's child items or linked items features to organize subtasks. Ensure your team is consistent in how these features are used.

Your primary goals are:

1. To understand Agile methodologies and apply them to your workflow.
2. To establish your project infrastructure using Docker and GitLab.
3. To implement initial features in a provided starter application.

By the end of this sprint, your team should have:

- A fully functional development environment.
- A running TODO List application deployed to your team server.

---

## Related Course Topics

This sprint will help you engage with the following course topics:

- Agile Software Development
- Scrum Board
- Docker
- Containerization
- Git Best Practices

---

## Learning Outcomes

The activities for this sprint will help you meet these learning course outcomes:

- **Explain** and **Use** the procedures involved in software design and development.
- **Describe** effective project management and team behaviours and **Evaluate** contributions.

## Sprint 1 Deliverables and Assessment Criteria

---

### Development (50%)

1. Fix the Bug (15 points)
  - Provide evidence that the solution is correct and has been tested.
2. Complete Two User Stories (20 points)
  - Stories must be implemented, tested, and deployed.
  - Evidence of task decomposition is required.
3. Complete the Tech Task (15 points)
  - Successfully set up the necessary project infrastructure as described in the task.

---

### Technology Use (50%)

1. Issue-Based Branching (10 points)
  - Use branching conventions provided in the group settings and enforce them in GitLab.
2. Meaningful Commit Messages (10 points)
  - Ensure commit messages describe the changes made clearly and concisely.
3. Application Deployment (10 points)
  - Deploy the team application to the team server.
4. Docker Use Across Team (20 points)
  - All team members must use Docker and Docker Compose for local development.
  - Document setup instructions in the team wiki.

Clearly document how you have satisfied each assessment criterion in the Sprint 1 wiki for your team. Undocumented work will result in penalties, even if the work was completed.

---

### Padding: 5 points

This course has a tight sprint delivery schedule and the instructional team will work to provide you with quick feedback. It is possible that we can make small mistakes due to the short grading periods. Therefore each sprint will get automatic 5-point padding. For example, if a sprint grade based on criteria above is 84 marks, the grade of 89 will be recorded instead. The maximum grade for each sprint will be capped at 100, so if your team receives, for example, 97 marks, your sprint grade will be recorded as 100.

If your team requests a regrade request for a sprint, a sprint will be fully regraded. If a sprint is regraded, this padding will be removed - the instructional team will be careful to grade the sprint accurately, and the padding will be unnecessary. Keep this in mind if you are considering submitting a regrade request.

---

## Peer evaluation

Each sprint will involve the peer evaluation, which must be submitted by every team member. Each team member would receive the overall peer evaluation score between 0 and 100%. The scoring guidelines will be posted in the peer evaluation widget.

The overall peer evaluation score received by each team member will then be used to scale each team member's sprint grade. The scaling factor of 1 will be used if the peer evaluation is 100% and will be computer, and adjusted accordingly otherwise (e.bg. 0.85 for peer evaluation of 85%, etc.)

The final grade for each sprint will be computed as follows;

*final sprint grade = team sprint grade (based on criteria above) \* individual peer valuation score (between 0 and 1)*

---

## Submission Instructions

All deliverables and evidence for this sprint must be documented on your team's Sprint 1 wiki page. Use the sprint page template to structure your submission:

- Replace placeholder text with your team-specific details
- Add any details you wish to help the person grading your work find the things you want them to grade.
- Follow the one-click rule discussed in lecture 1.
- Remember to document each team member's contribution to every sprint, backed up by the relevant Git logs
- **Don't make us search for things.** Undocumented contributions will not receive a grade.

---

## Deployment instructions

Use the instructions in the [README.md](#) of the [yatdl](#) project on GitLab. They are very detailed, and you have to follow them exactly. If you run into issues - e.g. you can't close your code on your dev server - you probably missed a step or made a mistake somewhere. Be careful and don't rush, and you won't run into any problems. Also, check the Sprint 1 FAQ.
